The long story of Greek terrorism was meant to have ended in the summer of 2002 with the collapse of the country's premier terrorist organisation and one of Europe's longest-running gangs, the notorious 17 November group (17N). However, rather than demoralising and emasculating the country's armed struggle movement, the dismantling of 17N and the imprisonment of its members led to the emergence of new urban guerrilla groups and an upsurge in and intensification of revolutionary violence. Given the sheer longevity of the 17N terrorist experience, George Kassimeris sets out to analyse the life histories of the group's imprisoned members. Their stories, told through their own words, offer us a clearer picture than we have ever had of the political and ideological environment that provided the foundations upon which revolutionary terrorism took root in the mid-1970s. This book also brings up to date the gritty story of Greek terrorism, by analysing the country's post-17N generation of urban guerrilla groups, placing their extremism and violence in a broader political and cultural perspective. The challenges to humanity posed by the digital future, the first detailed examination of the unprecedented form of power called "surveillance capitalism," and the quest by powerful corporations to predict and control our behavior. In this masterwork of original thinking and research, Shoshana Zuboff provides startling insights into the phenomenon that she has named surveillance capitalism. The stakes could not be higher: a global architecture of behavior modification threatens human nature in the twenty-first century just as industrial capitalism disfigured the natural world in the twentieth. Zuboff vividly brings to life the consequences as surveillance capitalism advances from Silicon Valley into every economic sector. Vast wealth and power are accumulated in ominous new "behavioral futures markets," where predictions about our behavior are bought and sold, and the production of goods and services is subordinated to a new "means of behavioral modification." The threat has shifted from a totalitarian Big Brother state to a ubiquitous digital architecture: a "Big Other" operating in the interests of surveillance capital. Here is the crucible of an unprecedented form of power marked by extreme concentrations of knowledge and free from democratic oversight. Zuboff's comprehensive and moving analysis lays bare the threats to twenty-first century society: a controlled "hive" of total connection that seduces with promises of

total certainty for maximum profit -- at the expense of democracy, freedom, and our human future. With little resistance from law or society, surveillance capitalism is on the verge of dominating the social order and shaping the digital future -- if we let it.

This book argues that the last eight years in particular have shown us that our democracy has largely evaporated, leaving behind only an exoskeleton that was once its original vertebrae of ends and principles. It is critical to our form of democracy in the U.S. that citizens become active participants.

Complete and Unabridged Version. Your Mind And How to Use It. A Manual Of Practical Psychology. It is not enough merely to have a sound mind—one must also learn how to use it, if he would become mentally efficient. Contents. What is the Mind, The Mechanism of Mental States, The Great Nerve Centers, Consciousness, Attention, Perception, Memory, Imagination, The Feelings, The Emotions, The Instinctive Emotions, The Passions, The Social Emotions, The Religious Emotions, The Aesthetic Emotions, The Intellectual Emotions, The Role of the Emotions, The Emotions and Happiness, The Intellect, Conception, Classes of Concepts, Judgments, Primary Laws of Thought, Reasoning, Inductive Reasoning, Deductive Reasoning, Fallacious Reasoning, The Will, Will-Training, Will-Tonic. PSYCHOLOGY is generally considered to be the science of mind, although more properly it is the science of mental states—thoughts, feelings, and acts of volition. It was formerly the custom of writers on the subject of psychology to begin by an attempt to define and describe the nature of mind, before proceeding to a consideration of the subject of the various mental spates and activities. But more recent authorities have rebelled against this demand, and have claimed that it is no more reasonable to hold that psychology should be held to an explanation of the ultimate nature of mind than it is that physical science be held to an explanation of the ultimate nature of matter. The attempt to explain the ultimate nature of either is futile—no actual necessity exists for explanation in either case. Physics may explain the phenomena of matter, and psychology the phenomena of mind, without regard to the ultimate nature of the substance of either.

The reader is about to embark on a journey of discovery and perhaps even reckoning. Religion and science have been understood as inherently at odds and inimical toward each other. However, both employ metaphor: religion when it calls the spirit descending upon Jesus a dove, science when it describes electrons as a current flowing through a wire, for only fluids flow and electrons are not a fluid. Both use myths: some religions in the sense that there was a Golden Age of humans in a garden, science when it promises unlimited progress. Both enlist hypothetical entities: some religions when a storm heralds that the gods are angry, science with the existence of a vacuum and a frictionless surface. And each bears its fundamentalist contingent: just observe a debate between creationists and evolutionists and the zeal and fervor with which the Bible and Darwin must be defended at any cost, no matter what. Given all this, it becomes readily apparent that religion and science display more in common than was once expected. And that is precisely what is in peril in the following pages--our expectations. May the intrepid traveler benefit from the voyage.
Image simulation grew out of an attempt to explain why electron microscope images of complex oxides sometimes showed black dots in patterns corresponding to the patterns of heavy metal sites in complex oxides, and yet other images sometimes showed white dots in the same patterns. This first application was therefore to characterize the experimental images, that is to relate the image character (the patterns of light and dark dots) to known features in the structure. Some simulations are done in order to thoroughly explore one particular image by "freeze-framing" the imaging process in the computer. The simulation programs can also be used to study the imaging process itself.

Da Official Guide to Hip-hop & Urban Slanguage

Being an Attempt at the Simplest Possible Introduction to the Subject, Based Entirely Upon Ear-training

In a controversial and unique study of lexicon, Mo Betta does what Merriam-Webster did for the English language; he has scrupulously compiled an authentic, comprehensive array of urban terms. Street Talk serves as the main reference guide for the Hip-Hop and Urban slang language. By collecting and combining all the various elements that influence, contribute to, and at times dictate the pulse of Hip Hop and urban "street" culture. Street Talk grew into one of the most comprehensive slang dictionaries ever written. Street Talk is, without a doubt, the most authentic Hip-Hop and urban slang dictionary to date. Despite the exclusion of derogatory terms for women, race, sexual preference, ethnicity, and religion, the book is by no means watered down or softened. The terms defined can be found everywhere in urban culture, including songs by today's most popular rappers. Drawing on his own authentic street knowledge and that of his peers, Mo Betta offers alluring insights into Hip-Hop and urban culture. Esther Williams and John Gottman describe a complete set of programs they have written in Fortran IV to enable even beginners to use all the techniques presented in John Gottman's Time-Series Analysis: A Comprehensive Introduction for Social Scientists. There are three packages, available on IBM card source desks from the authors, for (1) time and frequency domain model fitting, including detecting cycles, (2) forecasting and interrupted time-series analysis, and (3) multivariate time-series analysis, in both time and frequency domains. The packages have been tested for portability. Modification specific computers are noted in the guide.

Background: Annual rates of suicide have been on the rise for the past two decades in the U.S. In 2017, there were 47,173 confirmed suicide deaths and an estimated 1.4 million suicide attempts. Alcohol use and suicidal ideation are both independently associated with increased risk of suicide attempt. Depression assessment tools that include questions about suicidal ideation can help providers identify patients at risk of suicide attempt in the clinical setting where many seek care in the months prior to an attempt. Using routine self-reported assessment tools for risky patterns of alcohol use may also be useful for optimizing identification of suicide attempt risk. Additionally, understanding more about the patient experience answering questions about suicidal ideation could inform screening and assessment practices during routine care delivery. Therefore, this dissertation studied patients from a large regional healthcare system-Kaiser Permanente Washington-to evaluate whether patterns of patient-reported alcohol use can be used to identify patients at risk of suicide attempt (Aim 1) whether and how that association varies by report of suicidal ideation (Aim 2), and to understand how patients experience and answer questions about suicidal ideation (Aim 3). Methods: Aims 1 and 2 used electronic health record data to identify outpatient visits to a mental health provider with documented assessments for unhealthy alcohol use (via Alcohol Use Disorders Identification Test-Consumption or AUDIT-C) and depression symptom severity (via 9-item Patient Heath Questionnaire or PHQ-9) in Kaiser Permanente Washington (1/1/2010-6/30/2015). Logistic regression models were fit using generalized estimating equations were fit to conduct visit-level analyses, accounting for correlation between individuals0?9 assessments. Separate models evaluated the association of (1) level of alcohol consumption and (2) frequency of heavy episodic drinking (HED) with suicide attempt within 90 days following each visit. Additional stratified analyses were used to evaluate these associations by self-reported suicidal ideation (PHQ-9 ninth question). Primary models adjusted for age, gender, race/ethnicity and visit year. Aim 3 used criterion sampling to identify primary care patients who had recently completed the PHQ-9 ninth question with whom we conducted semi-structured interviews by phone, which were recorded and transcribed. Directive and conventional content

analysis were used to apply knowledge from prior research and elucidate new information from interviews; thematic analysis was used to organize key content. Results: Aim 1 primary analyses included 60,273 patient visits among 44,106 patients. At the first study period visit, 22% reported nondrinking, and 39%, 35%, and 5% reported low-, moderate-, and high-level drinking, respectively. Further, 65% reported no HED, 22% reported "less than monthly," 7% "monthly," 4% "weekly," and 2% reported "daily/almost daily" HED. Patients reporting high-level alcohol use were 2.59 times (95% CI, 1.80-3.74) more likely to attempt suicide compared to those reporting low-level use. Patients reporting daily/almost HED were 3.62 times (95% CI, 1.80-3.74) as likely to attempt suicide than those reporting no HED. Aim 2 primary analyses included 59,705 patient visits among 43,706 patients. At the first study period visit 26% reported having suicidal ideation in the past two weeks. Among these patients, risk of suicide attempt was significantly increased for those reporting high-level (OR 9.77, 95% CI, 6.23-15.34), moderate-level (OR: 4.94, 95% CI 3.49-6.98) and non-drinking (OR 5.86, 95% CI 4.00-8.58), relative to low-level alcohol use. Risk was increased for those reporting HED monthly or more (OR 6.80, 95% CI 4.77-9.72) and less than monthly (OR 5.16, 95% CI, 3.67-7.26) relative to those reporting no HED. Among patients reporting no suicidal ideation, no associations between alcohol use (consumption or HED) and suicide attempt risk were observed. In Aim 3, qualitative analyses revealed: 1) Participants believed being asked about suicidality was contextually appropriate and valuable, 2) Some participants described a mismatch between their lived experience and the PHQ-9 ninth question, 3) Suicidality disclosures involved weighing hope for help against fears of negative consequences, and 4) Provider relationships and acts of listening and caring facilitated discussions about suicidality. Conclusions: In these studies, we found that while patients believed being asked questions about suicidal ideation was appropriate, some described experiencing stigma and distanced themselves from suicidality. Further, we found that patterns of alcohol use obtained via routine self-reported assessment may help identify patients at higher risk of suicide attempt, but largely only among patients disclosing suicidal ideation. Findings underscored the value of offering alcohol-related care to patients reporting risky alcohol use patterns, especially to those also reporting suicidal ideation. More work is needed to optimize identification of patients at high-risk of suicide attempt who do not report suicidal ideation.
